

Project: Product Shop

Product Shop is a system that registers users, categories, products and orders. It is a significantly big project, and as such it will have several parts. In this exercise you will land the basics of the application, in other words - the user functionality.

Workshop: Part 5 – Shopping Cart

1. Views

These are the additional views you must implement.

Name: Hamburger

Description: Yammy

Price: 3,50

Quantity

Order Product

2. Establish the Back-End

Create the required:

- **Entities**
- **Models**
- **Repositories**
- **Services**
- **Controllers**

3. Functionality

Implement a shopping cart. You should be able to add products to cart, remove them, see details about the current condition of the cart and checkout.
